This readme file describes how one can estimate the method developed in "Robust Identification in Regression Discontinuity Designs with Covariates", available [here](#).

Follow these steps, in order:
1- Obtain the dataset that we use to replicate the main results from Amarante et al (2016). There is only one dataset that you need: "peso4_anonymized.dta", which can be downloaded in the paper's website [here](#).
2- Add all files to the same folder.
3- Open MainAnalysis.do, and change line 8 to add your directory path.
4- Run MainAnalysis.do.

MainAnalysis.do. reads into the dataset, and outputs the figures and the table in the application section of the paper. Please email us at gregorio.caetano@gmail.com if you have any questions!
